

Does anybody know if there are any good 2d-graphics packages available for IBM RS/6000 & AIX ? I'm looking for something like DEC's GKS or Hewlett-Packards Starbase, both of which have reasonably good support for different output devices like plotters, terminals, X etc.

I have tried also xgks from X11 distribution and IBM's implementation of Phigs. Both of them work but we require more output devices than just X-windows.

Our salesman at IBM was not very familiar with graphics and

I am not expecting for any good solutions from there.
