

What does a lack of taste of foods, or a sense of taste that seems "off" when eating foods in someone who has cancer mean? What are the possible causes of this? Why does it happen?

Pt has Stage II breast cancer, and is taking tamoxifen. Also has Stage IV lung cancer with known CNA metastasis, and is taking klonopin (also had cranial radiation treatments).

Thanks!

[not a doctor, but trying to understand family member's illness]
