

Ron Roth recommends: "Once you have your hypoglycemia CONFIRMED through the proper channels, you might consider the following:..."

[diet omitted]

1) Ron...what do YOU consider to be "proper channels"...this sounds suspiciously like a blood chemistry...glucose tolerance and the like...suddenly chemistry exists? You know perfectly well that this person can be saved needless trouble and expense with simple muscle testing and hair analysis to diagnose...no "CONFIRM" any aberrant physiology...but then again...maybe that's what you meant by "proper channels."

2) Were you able to understand Dick King's post that "90% of diseases is not the same thing as 90% of patients" which was a reply to your inability to critically evaluate the statistic you cited from the New England Journal of Medicine. Could you figure out what is implied by the remark "Of course MDs are ethically bound to not knowingly dispense placebos..."?

3) Ron...have you ever thought about why you never post in misc.health.alternative...and insist instead upon insinuating your untrained, non-medical, often delusional notions of health and disease into this forum? I suspect from your apparent anger toward MDs and heteropathic medicine that there may be an underlying 'father problem'...of course I can CONFIRM this by surrogate muscle testing one of my patients while they ponder my theory to see if one of their previously weak 'indicator' muscles strengthens...or do you have reservations about my unique methods of diagnosis? Oh..I forgot what you said in an earlier post.."neither am I concerned of whether or not my study designs meet your or anyone else's criteria of acceptance."
