This was known as \*Journey to the Far Side of the Sun\* in the United States and as \*Doppelganger\* in the U.K. It was produced by the great team of Gerry and Sylvia Anderson (whose science was usually a bit better than this). It may have been their first production using live actors-- they were better known for their technophilic puppet shows, such as \*Supercar\*, \*Stingray\*, and \*Thunderbirds\*. Later, they went on to do more live-action SF series: \*UFO\* and \*Space: 1999\*.

The astronomy was lousy, but the lifting-body spacecraft, VTOL airliners, and mighty Portugese launch complex were \*wonderful\* to look at.
